Abstract

Method for administering supplementary services in telecommunication systems

The call from a calling subscriber station (AR) is routed to an intelligent node (SCP) which is associated with the called subscriber station (AG). An operating menu (BM) in the form of a WAP page, which is transmitted to the called subscriber station (AG) and provides for the administration of the supplementary services is generated on the basis of the supplementary services (ZDV) available to the called subscriber station (AG).
